

3-1.
 (1) 基带的平均功率: $P_m = \frac{1}{2}$

(2) ① AM信号:

$P_{AM} = 1$, 即 $\frac{|m(t)|_{\max}}{A} = 1 \Rightarrow A = 1$

$$\begin{aligned} S_{AM}(t) &= [1 + m(t)] \cos 16000\pi t \\ &= [1 + \cos 2000\pi t] \cos 16000\pi t \\ &= \cos 16000\pi t + \frac{1}{2} \cos 16200\pi t + \frac{1}{2} \cos 15800\pi t \end{aligned}$$

AM信号的平均功率: $P_{AM} = \frac{A^2}{2} + \frac{\overline{m(t)^2}}{2} = \frac{1}{2} + \frac{1}{4} = \frac{3}{4}$

② DSB信号:

$$S_{DSB}(t) = m(t) \cos 2\pi f_c t = \cos 2000\pi t \cdot \cos 16000\pi t = \frac{1}{2} \cos 16200\pi t + \frac{1}{2} \cos 15800\pi t$$

DSB信号的平均功率: $P_{DSB} = \frac{1}{2} \overline{m(t)^2} = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$

③ SSB信号:

$$\begin{aligned} S_{SSB}(t) &= \frac{1}{2} [m(t) \cos 2\pi f_c t - \hat{m}(t) \sin 2\pi f_c t] \\ &= \frac{1}{2} [\cos 2000\pi t \cos 16000\pi t - \sin 2000\pi t \sin 16000\pi t] \\ &= \frac{1}{2} \cos 16200\pi t \end{aligned}$$

SSB信号的平均功率: $P_{SSB} = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8}$

(3) AM信号的解调框图:

① 相干解调:

② 包络检波:

3-2.

(1)

$$S_{AM}(t) = [A + m(t)] \cos 2\pi f_c t = A \cos 2\pi f_c t + m(t) \cos 2\pi f_c t$$

对比给出的AM信号 $s(t) = 4 \cos 1800\pi t + 12 \cos 1600\pi t + 4 \cos 1400\pi t$

得出载波频率应 ~~是~~ 三者频率中处于中间的频率

得出载波信号: $c(t) = \cos 1600\pi t$

基带信号: $m(t) = 8 \cos 200\pi t$

①

$$(2) S_{AM}(t) = (1 + 8\cos 200\pi t) \cos 1600\pi t$$

$$\therefore \text{调幅指数: } \beta_{AM} = \frac{|m(t)|_{\max}}{A} = \frac{8}{12} = \frac{2}{3}$$

(3). 幅度频谱:

功率谱密度:

(4). 调制效率:

$$\text{载波功率: } 36 + 36 = 72$$

$$\text{边带功率: } 4 \times 4 = 16$$

$$\therefore \eta_{AM} = \frac{16}{72 + 16} = \frac{2}{11} \approx 18.2\%$$

3-6. (1) 当本地载波为 $2\cos 2\pi f_c t$ 时: $P_{ni} = P_{no}$,

$\therefore$ 解调器前信噪比为 20dB,

$$\therefore \frac{P_{so}}{P_{no}} = 100$$

$\therefore$ DSB 调制, $G_{DSB} = 2$, 即 $\frac{SNR_o}{SNR_i} = 2 \Rightarrow SNR_i = 50$

$$\therefore P_{no} = P_{ni} = 10^{-9} \text{ W}$$

$$\therefore S_i = SNR_i \cdot P_{ni} = 50 \times 10^{-9} = 5 \times 10^{-8} \text{ W}$$

$$\therefore \text{发送机发出功率: } 5 \times 10^{-8} \times 10^{10} = 500 \text{ W}$$

(2) 当本地载波为 $\cos 2\pi f_c t$ 时:

$$\text{输出噪声表示 } n_o(t) = n_i(t) \cos 2\pi f_c t = [n_c(t) \cos 2\pi f_c t - n_s(t) \sin 2\pi f_c t] \cdot \cos 2\pi f_c t$$

$$= \frac{1}{2} n_c(t) + [\frac{1}{2} n_c(t) \cos 2\pi f_c t - \frac{1}{2} n_s(t) \sin 4\pi f_c t]$$

$$\text{经低通: } n_o(t) = \frac{1}{2} n_c(t)$$

$$\therefore P_{no} = \frac{1}{4} S^2 = \frac{1}{4} P_{ni} \quad (S^2 \text{ 表示噪声方差})$$

$$\text{对于 DSB 调制, } G_{DSB} = 2, \text{ 即 } \frac{SNR_o}{SNR_i} = \frac{P_{so}/P_{no}}{P_{si}/P_{ni}} = 2 \Rightarrow \frac{P_{so}}{P_{si}} = \frac{1}{2}$$

$$\therefore SNR_o = \frac{P_{so}}{P_{no}} = 100 \Rightarrow P_{so} = 100 \times P_{no} = 100 \times 10^{-9} = 10^{-7} \text{ W}$$

$$\therefore P_{si} = 2 P_{so} = 2 \times 10^{-7} \text{ W}$$

$$\therefore \text{发送机发送功率: } 2 \times 10^{-7} \times 10^{10} = 2000 \text{ W}$$

(3). 当本地载波为 $2\cos 2\pi f_c t$ 时:

$$P_{no} = P_{ni} = 10^{-9} \text{ W}$$

$$\text{对于 SSB 调制, } G_{SSB} = \frac{SNR_o}{SNR_i} = 1 \Rightarrow SNR_i = SNR_o = 100$$

$$\therefore S_i = SNR_i \cdot P_{ni} = 100 \times 10^{-9} \text{ W} = 10^{-7} \text{ W}$$

$$\therefore \text{发送机发送功率: } 10^{-7} \times 10^{10} = 1000 \text{ W}$$

3-7. (1) $H_{BPF}(f) = \begin{cases} 1 & 75\text{kHz} \leq |f| \leq 105\text{kHz} \\ 0 & \text{其他} \end{cases}$

(2) 输入端的信号功率: $P_{Si} = 10 + 40 = 50 \text{ (kW)}$

输入端的噪声功率: $P_{Ni} = N_0 \cdot B_{BPF} = 2 \times 0.5 \times 10^{-3} \times 10 \times 10^3 \text{ W} = 10 \text{ W}$

$\therefore (SNR)_i = \frac{P_{Si}}{P_{Ni}} = \frac{50 \times 10^3}{10} = 5000$

(3) $\eta_{AM} = \frac{P_{Si}}{P_{Si} + P_{Ni}} = \frac{50}{50 + 10} = \frac{5}{6}$

$\therefore G_{AM} = 2\eta_{AM} = \frac{2}{3}$

$\therefore (SNR)_o = G_{AM} \cdot (SNR)_i = \frac{2}{3} \times 5000 = 3333$

(4). 采用非相干解调: $G_{AM} = 2\eta_{AM} = \frac{2}{3}$
 $\therefore (SNR)_o = 3333$

(5). 信噪比增益: $G_{AM} = 2\eta_{AM} = \frac{2}{3} = 0.67$

3-12.

(1) 信噪比 10 dB, 则 $(SNR)_o = 10$

对于 DSB 调制, $G_{DSB} = 2$, 即 $\frac{(SNR)_o}{(SNR)_i} = 2 \Rightarrow (SNR)_i = 5$

输入噪声功率: $P_{Ni} = N_0 \cdot B_{BPF} = 2 \times 10^{-12} \cdot 2f_H = 2 \times 10^{-12} \times 2 \times 10^4 = 4 \times 10^{-8} \text{ W}$

$\therefore$ 输入信号功率: $P_{Si} = (SNR)_i \times P_{Ni} = 5 \times 4 \times 10^{-8} = 2 \times 10^{-7} \text{ W}$

$\therefore$ 发射功率: $P = 2 \times 10^{-7} \times 10^8 = 20 \text{ W}$

(2). 对于 SSB 调制, $G_{SSB} = 1$, 即 $\frac{(SNR)_o}{(SNR)_i} = 1 \Rightarrow (SNR)_i = 10$

输入噪声功率: $P_{Ni} = N_0 \cdot B_{BPF} = 2 \times 10^{-12} \cdot f_H = 2 \times 10^{-12} \times 10^4 = 2 \times 10^{-8} \text{ W}$

输入信号功率: $P_{Si} = 2 \times 10^{-8} \times 10 = 2 \times 10^{-7} \text{ W}$

$\therefore$ 发射功率: $P = 2 \times 10^{-7} \times 10^8 = 20 \text{ W}$

(3) $\eta_{AM} = \frac{\beta_{AM}^2 P_{Mn}}{1 + \beta_{AM}^2 P_{Mn}} = \frac{0.8^2 \times \frac{5}{8}}{1 + 0.8^2 \times \frac{5}{8}} = \frac{2}{7}$

$G_{AM} = 2\eta_{AM} = \frac{4}{7}$

$\therefore (SNR)_i = (SNR)_o / G_{AM} = 10 \times \frac{7}{4} = \frac{35}{2}$

输入噪声功率: $P_{Ni} = N_0 \cdot B_{BPF} = N_0 \cdot 2f_H = 4 \times 10^{-8} \text{ W}$

输入信号功率: $P_{Si} = P_{Ni} \cdot (SNR)_i = 4 \times 10^{-8} \times \frac{35}{2} = 7 \times 10^{-7} \text{ W}$

$\therefore$ 发射功率: $7 \times 10^{-7} \times 10^8 = 70 \text{ W}$

(3)

3-14.

$$(1) s(t) = \cos(10\pi \times 10^6 t + 10 \sin 20\pi t)$$

$$\text{调相指数: } \beta_{PM} = K_p \max|m(t)| = 5 \times 2 = 10$$

$$\text{带宽: } B = 2(\beta + 1)f_m = 2 \times 11 \times 10 = 220 \text{ Hz}$$

$$(2) \text{ 设 } S_{FM}(t) = \cos[10\pi \times 10^6 t + \varphi(t)]$$

$$\therefore \frac{1}{2\pi} \frac{d\varphi(t)}{dt} = f_m(t) = 10 \sin 20\pi t$$

$$\therefore \varphi(t) = -\cos 20\pi t$$

$$\therefore S_{FM}(t) = \cos[10\pi \times 10^6 t - \cos 20\pi t]$$

$$\text{调频指数: } \beta_{FM} = K_f \frac{\max|m(t)|}{f_H} = \frac{5 \times 2}{10} = 1$$

$$\text{带宽: } B = 2(\beta + 1)f_m = 2 \times 2 \times 10 = 40 \text{ Hz}$$

$$(3) \text{ 为单频信号, } \therefore \text{信噪比增益 } G = 3\beta_{FM}^2(\beta_{FM} + 1) = 3 \times 1 \times 2 = 6$$

$$\therefore \frac{SNR_o}{SNR_i} = 6 \Rightarrow SNR_o = 6 \times SNR_i = 30$$

3-15.

FM 调制信号的有效带宽:

$$B \approx 2(\Delta f_{\max} + f_m) = 2(15 + 75) = 180 \text{ (kHz)}$$

 $\therefore 180 \text{ kHz} < 200 \text{ kHz}, \therefore \text{没有超过}$

3-16.

$$(1) \text{ 平均功率: } P = \frac{A^2}{2} = \frac{100^2}{2} = 5 \times 10^3 \text{ W}$$

$$\text{调制指数: } \beta = 9$$

$$\text{最大相移: } \Delta\varphi_{\max} = 9 \text{ rad}$$

$$\text{最大频移: } \Delta f_{\max} = \beta f_m = 9 \times 1000 = 9000 \text{ Hz}$$

$$\text{带宽: } W = 2(\beta + 1)f_m = 2 \times 10 \times 1000 = 20 \text{ kHz}$$

$$(2) \text{ 输入信号功率: } P_{si} = \bar{P} \times 10^{-2} = 50 \text{ W}$$

$$\text{输入噪声功率: } P_{ni} = N_0 \cdot B = 10^{-8} \times 20 \text{ kHz} = 2 \times 10^{-4} \text{ W}$$

$$\text{输入信噪比: } (SNR)_i = \frac{P_{si}}{P_{ni}} = \frac{50}{2 \times 10^{-4}} = 2.5 \times 10^5$$

$$\text{信噪比增益: } G_{FM} = 3\beta_{FM}^2(\beta_{FM} + 1) \quad (\text{单频信号})$$

$$= 3 \times 9^2 \times 10 = 2430$$

$$\text{输出信噪比: } SNR_o = G_{FM} \cdot (SNR)_i = 2430 \times 2.5 \times 10^5 = 6.075 \times 10^8$$

3-18.

$$\text{信噪比增益: } G_{FM} = 6\beta_{FM}^2(1 + \beta_{FM})P_{MN}$$

$$= 6 \times 25 \times 6 \times \frac{3}{8} = 337.5$$

$$\text{输出信噪比: } (SNR)_o = 1000, \therefore \text{输入信噪比 } (SNR)_i = (SNR)_o / G_{FM} = 1000 / 337.5 = 2.963$$

$$\text{输入噪声功率 } P_{ni} = N_0 \cdot B = N_0 \cdot 2(1 + \beta)f = 3.6 \times 10^{-7}, \therefore \text{输入信号功率: } P_{si} = P_{ni} \cdot (SNR)_i = \frac{16}{15} \times 10^{-6} \text{ W}$$

$$\text{发送机发射功率: } \frac{16}{15} \times 10^{-6} \times 10^4 = \frac{16}{15} \times 10^{-2} = 1.067 \times 10^{-2} \text{ W}$$

④
